Muh Dotfiles

Aksel Olav Steen

April 7, 2025

1 Introduction

This are my dotfiles, there are many like them, but these are mine. My dotfiles is my best friend. It is my life.

Hosts are split into 3 categories:

- Sinnoh: Arch/Arch-like systems

    - Usernames: Gen IV pokemon

- Kalos: Darwin systems

    - Usernames: Gen VI pokemon

- Johto: NixOS systems

    - Usernames: Gen II pokemon

2 Steps to install

1. Install Nix

   ```
   sh <(curl -L https://nixos.org/nix/install)
   ```

2. Clone this repo

   ```
   git clone --recurse-submodules
   ↪  https://github.com/aksel-os/.dotfiles.git
   ```

   `--recurse-submodules` will also clone my emacs repo.

3. cd into `.dotfiles`

```
cd ~/.dotfiles/
```

4. Change placeholders in `flake.nix` and `.envrc`

```
sed -i '' -e 's/ARCHITECTURE/your_architecture/g' -e
↪  's/HOSTNAME/your_hostname/g' -e 's/USERNAME/your_username/g'
↪  flake.nix
sed -i '' -e 's/USERNAME/your_username/g' -e
↪  's/HOSTNAME/your_hostname/g' .envrc
```

Note: mac requires and empty string for `-i`, if you're on linux you should remove the empty string

5. Build the flake

```
make system arg=nixos or darwin
make home TRAINER_USER_PROFILE="your_username"
```

3 Updating

After making any changes to the user level modules, run

```
make home
```

Changes at the system level will require you to run

```
make system arg=nixos or darwin
```

To update the flake.lock run the following:

```
make update
```

<div class="note"> Both `system` and `home` has `update` as a dependency. To run `system` or `home` without `update` you should append the `-o` flag, e.g. `make -o home`. </div>

4 Future plans

Make a cli like GUIX to manage things. Inspired by librephoenix and hlissner's dotfiles
